Reference environment for this work

What each harness records and exports.

Our comparison categories, not vendor-defined levels. Metrics, events and traces are all telemetry.

Collection method	Codex CLI	Claude Code	OpenCode
01 / LOCAL **Saved by default** Read after a session	**Messages, tool calls/results, timestamps and token usage.** Input, cached input, output and reasoning counts in local rollouts. `~/.codex/ · local session files`	**Messages, tool calls/results and token/cost statistics.** JSONL transcripts, including subagents. CLI session cleanup defaults to 30 days. `~/.claude/ · transcripts + stats`	**Sessions, messages, tool inputs/results, tokens and cost.** Usage fields include input/output, cache read/write and reasoning.* `~/.local/share/opencode/`
02 / EXPORT **Metrics & logs** Configure collection	**Token counts; API/tool durations, outcomes and approvals.** Configure OTel log and metric exporters plus the collector endpoint. `otel.exporter · otel.metrics_exporter`	**Tokens/cache, cost, active time, API calls and tool events.** Enable telemetry; select metric/log exporters and the collector endpoint. `CLAUDE_CODE_ENABLE_TELEMETRY=1`	**Native OTLP/HTTP logs; metrics via plugins.*** Built-in JSON session export and token/cost summaries remain available. `opencode export · opencode stats`
03 / TRACING **Timed spans** Optional telemetry: what ran, for how long	**Native OTLP trace exporter.** Enable separately and set the destination. Actual span coverage needs a real-run check. `otel.trace_exporter`	**Interaction → API / tool spans** Beta Includes nested subagent calls. Enable enhanced telemetry and a trace exporter. `Beta flag + trace exporter`	**Native OTLP/HTTP traces in v1.19.0.*** Set the endpoint; enable AI SDK spans with `experimental.openTelemetry`. MLflow/Langfuse plugins also exist. `OTEL_EXPORTER_OTLP_ENDPOINT`

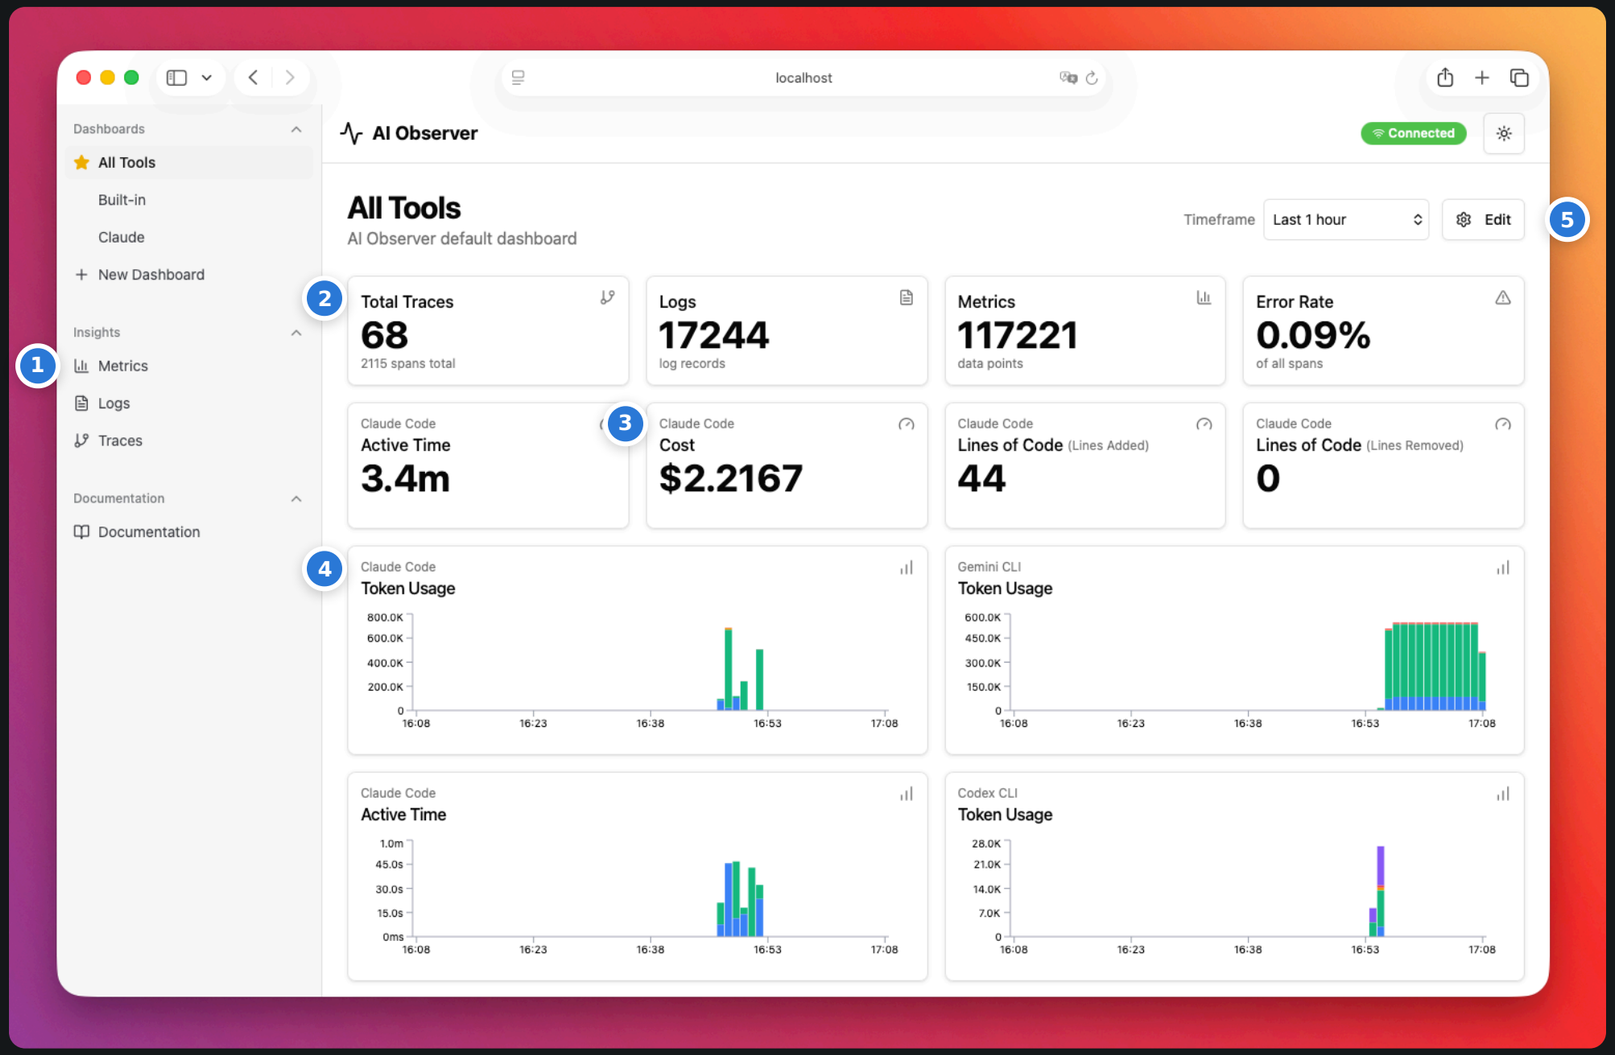

Our integration work Normalize these records; correlate task → agent → step; add process CPU/RAM measurements.

OTel = OpenTelemetry; OTLP = its export protocol. *OpenCode: v1.19.0 source; metrics plugin documented separately. Coverage varies by version/provider. Export delivery and span linkage need a live check. Provider analytics have separate defaults.

› Look at sessions on this host in last couple of days - what should we improve? What is causing
  tokens waisted and unnecessary long runs of staging vms? Be short

• I'll check recent session logs and staging VM usage for repeated work and avoidable idle time. I'm
  using the caveman skill to keep the findings brief.

• Ran pwd && rg --files -g 'AGENTS.md' -g '*session*' -g '*staging*' -g '*vm*' -g 'SKILL.md' -g
  | '*testing*' -g '*log*' .agents docs | head -100
```

• Main improvements, from Oct 12–14 sessions:

- **Reduce coordination chatter.** Last 48 hours: 27,308 model responses; roughly 8,000 involved only waiting or agent coordination. One session explicitly admitted unnecessary minute-by-minute wakeups. Use one observer; report completion, failures, or meaningful progress.
- **Avoid restarting broad acceptance for fixture edits.** A one-line `yard start` fix triggered cancellation of full P0 and another local-gate cycle—even though the runtime archive stayed identical. Reuse unaffected evidence; rerun affected checks.
- **Check fixture prerequisites before expensive setup.** Failures included executing inside a stopped yard, missing Claude CLI, unsupported legacy configuration, and shared data-root assumptions. Short preflight checks would catch these earlier.
- **Fix VM preparation and deadline handling.** Duplicate cloud-init seeding caused an extra reboot before agent readiness. Today's fix reached first readiness in ~160 seconds, then the next boot check exhausted the operation deadline; diagnostic capture also failed. This remains unresolved.

Priority: stop duplicate monitoring, validate fixtures early, and finish boot/deadline repairs before further broad retries.

Exact wasted VM-hours aren't established; waiting/coordination counts aren't all waste.

Worked for 2m 50s • 3:23 PM

Example: ask for a review of recent sessions, then validate the findings.

User-supplied agent report · Oct 12–14 sessions

Thank you.

LLMs are great tools.

Use them wisely.
